Chemistry 59-230/232
Time: 3 h

Final Exam
Dec. 15, 2005

NAME $\qquad$ ID\# $\qquad$

## LAB SECTION (or TA name)

Note: Please answer on the test paper. There is an extra sheet for rough work at the back, but it will not be marked. In some questions, there is a choice of questions to answer. If all are answered, all will be marked. There are 140 marks on this exam.

1. Fill in the blanks with the structural formula or reagents required to complete the equation. Show any required catalysts or additional reagents over the arrow. Make sure your drawings show stereochemistry if it is important. N ote: Entry "i." is worth 2 entries. Do any ten (10), but including i. ( 40 marks total)
a.

b.

C.

d.

e.

g.

h.

3) $\mathrm{H}_{2} \mathrm{O}$
i.

> 2 equiv
> 1) $\mathrm{LiAlH}_{4}$
2) $\mathrm{H}^{+}, \mathrm{H}_{2} \mathrm{O}$
j.

2a. (12 marks total) Draw the structure of trans 1-(1,1-dimethylethyl)-2-fluorocyclohexane in its most stable chair conformation. Label the non hydrogen substituents on the cyclohexane as axial or equatorial. In terms of size, a 1,1-dimethylethyl group (a.k.a tert-butyl group) is larger than an fluoro group. (5 marks)
b. Draw the N ewman projection of the following compound in its most stable conformation, as viewed down the $\mathrm{C} 3-\mathrm{C} 4$ bond. W ith respect to size, $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}>\mathrm{CH}_{3} \mathrm{CH}_{2}>\mathrm{CH}_{3}>\mathrm{Br}{ }^{\sim} \mathrm{Cl}{ }^{\sim} \mathrm{F}>\mathrm{H}$. W hat is the name of this compound, including its stereochemical descriptor(s) ? (7 marks)

## 3. a. (13 marks total)

Draw the complete mechanism for the following reaction. Take the reaction to completion. Indicate which steps are reversible (or irreversible). Provide a valid IUPAC name for the starting material, including the stereochemical descriptor. (8 marks)

b. In the reaction of a ketone (lets say 2,6 -dimethylheptan- $4-$ one) with an alcohol (let's say it's $\mathrm{CH}_{3} \mathrm{OH}$ ) one never gets an acetal under base catalyzed conditions. Show by intermediates and reaction steps why is this is the case ( 5 marks). The complete answer will include the structure of 2,6-dimethylheptan-4-one.
4. ( $\mathbf{3 3}$ marks total) Describe the relationship that exists between the following sets of compounds (i.e., enantiomer, diastereomer, geometric isomer, structural/constitutional isomer, identical). Indicate any meso forms (9 of the 33 marks).
a.

b.

C.

Also, identify the chiral centres for the left compound in a) and $c$ ) as ( $R$ )- or (S)- (8 of 33 marks)
d. Draw the Fischer projection of (2S, 4R)-2-chloro-4-iodopentane. (4 of the 33 marks).
e. Identify the hybridization of each carbon atom in the following molecule. (3 of the 33 marks)

f. In the above compound (in e), assign the appropriate stereochemical descriptor to the alkene. Show your work (6 marks)
g. Identify the carbon atoms in the following compound as primary, secondary, tertiary, or quaternary (3 of the 33 marks).

5. $\mathrm{O} n$ the axes below, draw the energy/reaction coordinate profile for the reaction between $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}=\mathrm{CH}_{2}+$ HBr (the mechanism should be implied in the answer). Label the intermediate(s)/products.

Give the rate equation for the reaction. ( 6 marks total)
rate $(\mathrm{v})=$
6. ( $\mathbf{1 6}$ markstotal) Rank the following in terms of tendency to undergo $S_{N} 2$ substitution (as opposed to $S_{N} 1$ ). Give reasons for your ordering and the expected products. (13 of the 16 marks) Assume the same solvent for each of the reactions.
a)

b)

c)

$\mathrm{CH}_{3} \mathrm{OH}$

$\xrightarrow{\mathrm{CH}_{3} \mathrm{OH}}$ ?
d. Rank the following from best nucleo phile to worst nucleophile ? (3 of the 16 marks)
$\mathrm{CH}_{3} \mathrm{C}\left(\mathrm{O}^{\circ} \mathrm{O}^{-}, \mathrm{Br}^{-}, \mathrm{I}^{\circ}, \mathrm{HO}^{\circ}, \mathrm{HS}\right.$
7. (9 marks) a and b Indicate all reasonable resonance forms of the following ions, using curved arrows to indicate electron movement. If there are unreasonable resonance forms, either do not draw them or label them as unreaso nable. If there is a case for which there are no other resonance forms, state that fact.
a.

b.

8. (11 marks total) Show by equation how you carry out the following overall transformations. Show all reagents and the structures of each reaction product. There is quite possibly more than one correct way to accomplish this overall transformation. DO one of $\mathbf{a}$ and $\mathbf{b}$, but answer $\mathbf{c}$ regardless.
a.

b.

c. W hat is the name of the final product compound in $\mathbf{8 b}$ ? (3 of the 11 marks)

Bonus: (up to +3 ) In esters, the 'carbonyl' oxygen is the basic one, and not the 'ether type' one. W hy is this the case?

Another Bonus (up to +5 ): An excellent way to introduce a bromine a- to (next to) a ketone function is adding $\mathrm{Br}_{2}$, with an acid catalyst. C an you propose a reaso nable mechanism?
