How to make a test print from multiple images/files

In order to get the best prints possible, and to understand how the digital image on the screen translates to ink on a page we encourage you to run test prints.
Putting multiple images onto one test print will save you money, and allow you to see any colour variations between files.

Step 1. Open a new file in photoshop in the appropriate dimensions for your test paper. Ensure that the resolution is 330dpi.

Step 2. Open all the files you intend to print.

Step 3. Using the rectangular marquee tool, highlight a section of one image. The section should be the entire width, and 3.5-4cm thick. Choose a place with a lot of tonal variation if at all possible.

Step 4. Copy the selection.

Step 5. Paste the selection onto the new test print file.

Step 6. Repeat until there is a section of each print file on your test print file.

Step 7. Save file.

Step 8. Print.

Step 9. Make any adjustments necessary using adjustment layers. (LAYER-> NEW
ADJUSTMENT LAYER-> Brightness/Contrast, Colour Balance, Curves, etc)
Save before re-printing.
